HEART RESEARCHERS -- Drs. Michael Brown (left) and Joseph Goldstein congratulate each other at a news conference in Cambridge (Massachusetts) after winning the 1985 Nobel Prize in Medicine. They were honored for research on how cholesterol accumulates in the human body, causing coronary ailments. Their findings have revolutionized treatment and prevention of heart disease, primarily by establishing a link between diet and the buildup of fatty deposits in blood vessels. Both men work for the Texas Health Science Center in Dallas.
