

TIRDS I CAMERAS PHOTOGRAPH CYCLONIC FLOW OVER CENTRAL PACIFIC — The contrast between the wide and narrow angle cameras aboard Tirds I, the meteorological satellite launched by the United States April 1, can be seen in these two photographs. The wide-angle view (left) shows giant bands of clouds indicating cyclonic flow. The camera was pointing downward and to the west over the Central Pacific. The picture at right shows detail of the cloud structure taken with the narrow-angle camera. (60-5537)
