Tutor: D. Manuel Sánchez Rubio

Abstract

In this PFG we will be carried out a detailed description of the used tools in the University Chair Amaranto to make Security Analysis. For it, we will use vulnerabilities scanning tools, and the most important are DVWA and WebGoat.

DVWA and WebGoat are applications deliberately unsafe, they are designed for practicing different vulnerabilities.

This PFG included a CDROM which contains six PowerPoint presentations and a lot of videos. It will facilitate the learning of vulnerabilities.

The final aim is to find these vulnerabilities to create safe webs.
