The photograph is a government publication—not subject to copy right.

It may not be used to state or imply the endorsement by NASA or by any NASA employee of a commercial product, process or service or used in any other manner that might mislead. Accordingly, it is requested that if this photograph is used in advertising, and other commercial promotion, layout and copy be submitted to NASA prior to release.

Iapetus is the subject of this color composite, prepared from images taken Aug. 22 when Voyager 2 was 1.1 million kilometers (680,000 miles) from this satellite of Saturn. The northern hemisphere is in view, including the north polar region of the right and a band of dark terrain near the equator on the left. Craters may be seen in both the dark and bright regions. Some craters in the bright region have dark floors and appear to be flooded with material that may have erupted from the interior of the satellite. The Voyager project is managed for NASA by the Jet Propulsion Laboratory, Pasadena, Calif.
