This computer-generated photograph was created from a cross section of Saturn's rings as measured by the Voyager 2 photopolarimeter's occultation of the star Delta Scorpii on Aug. 25. The region shown about 100 kilometers (60 miles) wide, is near the inner edge of the Encke division in the outer part of the A-ring. The waves seen at left become successively closer together nearer to the Encke division. At right are four strands of the ringlet that lies within the Encke division; Voyager 2's imaging system saw this structure as a single ringlet. Resolution here is about 1 km. (0.6 mi.). The Voyager project is managed for NASA by the Jet Propulsion Laboratory, Pasadena, Calif.
