

PICTURE STORY NO. 714 -- "Manned Space Flight"

13-15 A device that records the physical and psychological reactions to space flight has been developed in the United States. Whether a man is in a chamber like this that simulates conditions in space, or in orbit around the earth, the new device can measure and magnify on a glass panel his reactions to exercise or other types of work. The lines across the glass, resembling electrocardiogram readings, are transmitted by a tiny device attached to the prospective astronaut's vest.
