Table of Contents Synopsis:

Copper(I) and silver(I) complexes $[(CF_3SO_2O)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}]$ react with a variety of donor molecules L to give the ionic compounds $[(L)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ (L = NH₃, py, CNAr, CN*t*Bu, PPh₃) whose cations contain [MTi₃N₄] cube-type cores. The analogous treatment with bisphosphanes Ph₂P(CH₂)_nPPh₂ (n = 1, 2) gives 1:1 adducts $[(dppm)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ or 2:1 systems where a dppm or dppe ligand bridge two cube-type cations.

Abstract:

Copper(I) and silver(I) ionic compounds $[(L)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}][O_3SCF_3]$ containing [MTi₃N₄] cube-type cations have been prepared by reaction of $[(CF_3SO_2O)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}]$ (M = Cu (2), Ag (3)) with a variety of donor molecules L. Treatment of complexes 2 and 3 with NH₃ in toluene at room adducts $[(H_3N)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3$ temperature gives the ammonia N)}][O₃SCF₃] (M = Cu (4), Ag (5)), whose X-ray crystal structures reveal two cube-type cations associated through hydrogen bonding interactions between the ammine ligands and one oxygen atom of each trifluoromethanesulfonate anion. Analogous treatment of 2 and 3 with one equivalent of pyridine, 2,6-dimethylphenylisocyanide, tert-butylisocyanide, or triphenylphosphane gives the ionic compounds $[(L)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-Me_$ N)}][O₃SCF₃] (L = py, M = Cu (6), Ag (7); L= CNAr, M = Cu (8), Ag (9); L = CNtBu, M = Cu (10), Ag (11); L = PPh₃, M = Cu (12), Ag (13)). The reactions of 2 and 3 with methylenebis(diphenylphosphane) (dppm) in a 1:1 ratio lead to the single-cube complexes $[(dppm)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}][O_3SCF_3]$ (M = Cu (14), Ag (15)), whereas in a 2:1 ratio give the bisphosphane-bridged double-cube compounds $[{M(\mu_3-NH)_3Ti_3(\eta^5 C_5Me_5_3(\mu_3-N)_2(\mu-dppm)$ [O₃SCF₃]₂ (M = Cu (16), Ag (17)). Similarly, treatment of 2 or **3** with a half equivalent of ethane-1,2-diylbis(diphenylphosphane) (dppe) affords doublecube derivatives $[{M(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}_2(\mu-dppe)][O_3SCF_3]_2$ (M = Cu (18), Ag (19)). The X-ray crystal structures of 4, 5, 10, 14, 15, and 18 have been determined.

Introduction

An extensive coordination chemistry of copper and silver has been developed with tridentate nitrogen-based ligands. Among the numerous ligands pursued in this vein, the family of the anionic tris(pyrazolyl)borates is the most widespread because of their ability to serve as versatile facially coordinating six-electron donors to metal ions.¹ The electronic properties and especially the flexible coordination ability of these tripodal ligands have permitted the isolation of a large number of relevant novel species of copper(I) and silver(I).^{2,3} In comparison, the chemistry of tris(pyrazolyl)methane ligands,^{1b,4} the neutral analogues of the tris(pyrazolyl)borates, has been traditionally underdeveloped, although many copper and silver complexes with these ligands are known in nowadays.⁵ More rigid neutral *fac*-coordinating N₃-donor ligands employed in group 11 metal complexes are cyclic triamines such as 1,4,7-triazacyclononanes⁶ and 1,3,5-triazacyclohexanes.⁷

As part of a program devoted to the development of polynuclear nitrido complexes,⁸ we have been studying the coordination chemistry of the trinuclear titanium imido-nitrido complex [{Ti(η^5 -C₅Me₅)(μ -NH)}₃(μ ₃-N)]^{9,10} (1). Complex 1 shows a six-membered [Ti₃(μ -NH)₃] ring with three NH electron-donor imido groups and exhibits a strong resemblance to 1,4,7-triazacyclononane and, especially, 1,3,5-triazacyclohexane ligands. This similarity prompted us to explore its potential application as a tridentate, preorganized,¹¹ metalloligand toward a variety of metals. Thus, our group has reported extensively about the use of 1 as a neutral tridentate chelate ligand among the transition,¹² lanthanide,¹³ and main-group metals.¹⁴ In particular, we have demonstrated that complex 1 entraps one equivalent of copper(1) or silver(1) trifluoromethanesulfonate to give the adducts [(CF₃SO₂O)M{(μ_3 -NH₃Ti₃(η^5 -C₅Me₅)₃(μ_3 -N)}] (M = Cu (2),¹⁵ Ag (3)¹⁶). The poor

solubility in hydrocarbon solvents and the IR spectroscopic data of compounds 2 and 3 suggested a weak interaction between the triflate anions and the group 11 metal ions. Given the poor coordinating capability of the trifluoromethanesulfonate anion,¹⁷ we became interested in the use of complexes 2 and 3 as precursors to a range of derivatives formed by substitution of this labile ligand by ligands of greater nucleophilicity. Herein we describe the results obtained in the treatment of 2 and 3 with a variety of donor molecules L to produce a series of ionic complexes [(L)M{(μ_3 -NH)_3Ti_3(η^5 -C₅Me₅)₃(μ_3 -N)}][O_3SCF₃]. The synthesis, structures, and properties of the new compounds are discussed and compared with other copper and silver derivatives containing tridentate nitrogen-based ligands.

Experimental Section

General Considerations. All manipulations were carried out under argon atmosphere using Schlenk line or glovebox techniques. Hexane and toluene were distilled from Na/K alloy just before use. Dichloromethane was dried with P₂O₅ and distilled prior to use. Fluorobenzene was dried with CaH₂ and distilled prior to use. NMR solvents were dried with Na/K alloy (C₆D₆) or calcium hydride (CDCl₃, CD₂Cl₂) and vacuum-distilled. Ovendried glassware was repeatedly evacuated with a pumping system (ca. 1×10^{-3} Torr) and subsequently filled with inert gas. The syntheses and characterization of silver derivatives were carried in the dark by using amber stained glassware in all the manipulations. Electronic grade ammonia (purity > 99.995%, $O_2 < 2$ ppm, and $H_2O < 10$ ppm) was purchased from Sociedad Española del Oxígeno, and used as received. Pyridine (purchased from Aldrich) was distilled from CaH₂. 2,6-Dimethylphenylisocyanide, tertbutylisocyanide, methylenebis(diphenylphosphane) (dppm) and ethane-1.2divlbis(diphenylphosphane) (dppe) were purchased from Aldrich and used as received. Triphenylphosphane was purchased from Aldrich and sublimed under vacuum prior to use. $[(CF_3SO_2O)Cu\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}] \cdot C_7H_8 (2 \cdot C_7H_8)^{15} \text{ and } [(CF_3SO_2O)Ag\{(\mu_3-NH)_3Ti_3(\eta^5-NH$ NH)₃Ti₃(η^5 -C₅Me₅)₃(μ_3 -N)}] (3)¹⁶ were prepared according to published procedures.

Samples for infrared spectroscopy were prepared as KBr pellets and the spectra were obtained using an FT-IR Perkin Elmer SPECTRUM 2000 spectrophotometer. ¹H, ¹³C{¹H}, ¹⁹F and ³¹P{¹H} NMR spectra were recorded on a Varian Unity-300 and/or Unity-500 Plus spectrometers. Chemical shifts (δ , ppm) in the ¹H and ¹³C{¹H} NMR spectra are given relative to residual protons or to carbon of the solvent. Chemical shifts (δ , ppm) in the ¹⁹F

and ³¹P{¹H} NMR spectra are given relative to CFCl₃ or H₃PO₄ as external references. Microanalyses (C, H, N, S) were performed in a Leco CHNS-932 microanalyzer.

Synthesis of [(H₃N)Cu{(μ₃-NH)₃Ti₃(η⁵-C₅Me₅)₃(μ₃-N)}][O₃SCF₃] (4). A 100 mL ampule (Teflon stopcock) was charged with 2·C₇H₈ (0.15 g, 0.16 mmol) and toluene (20 mL). After cooling at -78 °C, the argon atmosphere was changed by NH₃. The reaction mixture was allowed to warm to room temperature and stirred for 16 h. The volatile components were removed under reduced pressure and the resultant orange solid was washed with toluene (5 mL) and vacuum-dried to give **4** (0.10 g, 77%). IR (KBr, cm⁻¹): \tilde{v} 3383 (w), 3355 (w), 3346 (m), 3306 (s), 3266 (w), 3223 (w), 3184 (w), 2910 (s), 2859 (m), 1620 (m), 1490 (w), 1429 (m), 1378 (s), 1266 (vs), 1223 (s), 1156 (vs), 1031 (vs), 785 (m), 729 (s), 695 (m), 646 (vs), 572 (w), 517 (m), 476 (w), 433 (m), 406 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): *δ* 11.71 (s broad, 3H; NH), 2.12 (s broad, 3H; NH₃), 2.02 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): *δ* 120.2 (*C*₅Me₅), 11.6 (C₅*Me*₅), the CF₃ carbon atom resonance was not detected. ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): *δ* -78.1 (CF₃). Anal. Calcd for C₃₁H₅₁CuF₃N₅O₃STi₃ (*M_w* = 837.98): C 44.43, H 6.13, N 8.36, S 3.83. Found: C 44.13, H 5.77, N 7.92, S 3.42.

Synthesis of [(H₃N)Ag{(μ₃-NH)₃Ti₃(η⁵-C₅Me₅)₃(μ₃-N)}][O₃SCF₃] (5). In a fashion similar to the preparation of **4** but using an amber stained ampule, the reaction of **3** (0.15 g, 0.17 mmol) in toluene (20 mL) with NH₃ afforded $5 \cdot 0.5C_7H_8$ as an orange solid (0.080 g, 50%). IR (KBr, cm⁻¹): \tilde{v} 3376 (m), 3340 (m), 3325 (m), 3275 (m), 3220 (w), 3183 (w), 2947 (m), 2910 (s), 2859 (m), 1617 (w), 1604 (w), 1496 (w), 1452 (m), 1430 (m), 1380 (s), 1278 (vs), 1256 (vs), 1222 (s), 1153 (vs), 1030 (vs), 766 (m), 742 (s), 653 (vs), 638 (vs), 571 (m), 517 (m), 477 (m), 428 (m), 403 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): *δ* 12.33 (s broad, 3H; NH), 2.05 (s, 45H; C₅Me₅), 1.94 (s broad, 3H; NH₃). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 120.8 (*C*₅Me₅), 11.8 (C₅*Me*₅), the CF₃ carbon atom resonance was not detected. ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -78.1 (CF₃). Anal. Calcd for C_{34.5}H₅₅AgF₃N₅O₃STi₃ (*M_w* = 928.38): C 44.64, H 5.97, N 7.54, S 3.45. Found: C 44.65, H 5.86, N 7.28, S 3.34.

Synthesis of [(py)Cu{(μ3-NH)3**Tia(η⁵-C**5**Me**5)3(μ3-N)}]**[O**3**SCF**3**] (6).** A 100 mL Schlenk flask was charged with **2**·C₇H₈ (0.20 g, 0.22 mmol), pyridine (0.020 g, 0.25 mmol) and toluene (20 mL). The reaction mixture was stirred at room temperature for 16 h to give an orange suspension. The volatile components were removed under reduced pressure, and the resultant solid was washed with toluene (5 mL) and vacuum-dried to afford **6**·0.5C₇H₈ as an orange solid (0.17 g, 81%). IR (KBr, cm⁻¹): \tilde{v} 3348 (w), 3308 (m), 3024 (w), 2910 (s), 2859 (m), 1603 (m), 1495 (w), 1487 (w), 1445 (s), 1378 (s), 1276 (vs), 1259 (vs), 1223 (s), 1152 (vs), 1066 (w), 1031 (vs), 753 (s), 733 (s), 699 (m), 665 (s), 638 (vs), 571 (w), 517 (m), 476 (m), 431 (m), 404 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.78 (s broad, 3H; NH), 8.07 (m broad, 2H; *o*-py), 7.78 (m, 1H; *p*-py), 7.44 (m, 2H; *m*-py), 2.05 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 150.9, 138.3, 125.8 (py), 120.6 (*C*₅Me₅), 11.7 (C₅*Me*₅), the CF₃ carbon atom resonance was not detected. ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -78.0 (CF₃). Anal. Calcd for C_{39.5}H₅₇CuF₃N₅O₃STi₃ (*M_w* = 946.12): C 50.14, H 6.07, N 7.40, S 3.39. Found: C 50.19, H 5.84, N 6.99, S 2.87.

Synthesis of $[(py)Ag\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ (7). In a fashion similar to the preparation of **6**, the treatment in an amber stained Schlenk flask of **3** (0.20 g, 0.23 mmol) with pyridine (0.020 g, 0.25 mmol) in toluene (20 mL) afforded **7**·0.5C₇H₈ as a green solid (0.18 g, 78%). IR (KBr, cm⁻¹): \tilde{v} 3358 (w), 3313 (m), 3026 (w), 2911 (s), 2859

(m), 1602 (m), 1495 (m), 1445 (s), 1379 (s), 1279 (vs), 1261 (vs), 1222 (s), 1148 (vs), 1051 (m), 1031 (vs), 786 (s), 733 (s), 702 (s), 654 (vs), 637 (vs), 571 (m), 517 (m), 477 (m), 428 (m), 402 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 12.32 (s broad, 3H; NH), 8.31 (m broad, 2H; *o*-py), 7.74 (m, 1H; *p*-py), 7.37 (m, 2H; *m*-py), 2.05 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 151.3, 137.6, 124.9 (py), 120.7 (*C*₅Me₅), 11.8 (*C*₅*Me*₅), the CF₃ carbon atom resonance was not detected. ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.8 (CF₃). Anal. Calcd for C_{39.5}H₅₇AgF₃N₅O₃STi₃ (*M*_w = 990.45): C 47.90, H 5.80, N 7.07, S 3.24. Found: C 47.88, H 5.69, N 6.59, S 3.25.

Synthesis of [(ArNC)Cu{(μ₃-NH)₃Ti₃(η⁵-C₅Me₅)₃(μ₃-N)}][O₃SCF₃] (8). In a fashion similar to the preparation of 6, the treatment of 2·C₇H₈ (0.15 g, 0.16 mmol) with 2,6dimethylphenylisocyanide (0.022 g, 0.17 mmol) in toluene (20 mL) afforded 8·0.5C₇H₈ as a green solid (0.14 g, 88%). IR (KBr, cm⁻¹): \tilde{v} 3364 (m), 3282 (m), 2912 (s), 2859 (m), 2160 (vs, v(CN)), 1603 (w), 1495 (m), 1448 (m), 1428 (m), 1379 (m), 1260 (vs), 1222 (m), 1149 (s), 1031 (vs), 783 (m), 736 (m), 711 (m), 648 (vs), 636 (vs), 571 (w), 516 (w), 506 (w), 479 (w), 437 (m), 407 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.74 (s broad, 3H; NH), 7.27-7.08 (m, 3H; C₆H₃Me₂), 2.27 (s, 6H; C₆H₃Me₂), 2.07 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 148.2 (s broad, CN), 135.2, 130.1, 128.2, 125.5 (C₆H₃Me₂), 121.3 (C₅Me₅), 121.0 (q, ¹*J***(C,F) = 320 Hz; CF₃), 18.7 (C₆H₃Me₂) 11.8 (C₅Me₅). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.9 (CF₃). Anal. Calcd for C_{39.5}H₆₁AgF₃N₅O₃STi₃ (M_w = 994.48): C 47.71, H 6.18, N 7.04, S 3.22. Found: C 46.94, H 6.34, N 6.84, S 2.97.**

Synthesis of $[(Ph_3P)Cu\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ (12). In a fashion similar to the preparation of **6**, the treatment of $2 \cdot C_7H_8$ (0.20 g, 0.22 mmol) with PPh₃ (0.060 g, 0.23 mmol) in toluene (20 mL) afforded **12** as a yellow powder (0.18 g, 75%). IR (KBr, cm⁻¹): \tilde{v} 3361 (m), 3348 (m), 3054 (w), 2910 (s), 2858 (m), 1586 (w), 1479 (m), 1436 (s), 1378 (s), 1275 (vs), 1263 (vs), 1221 (s), 1182 (w), 1144 (vs), 1095 (m), 1030 (vs), 747 (s), 695 (s), 669 (m), 646 (vs), 637 (vs), 571 (w), 520 (s), 496 (m), 438 (m), 410 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.67 (s broad, 3H; NH), 7.52-7.38 (m, 9H; *o*- and *p*-C₆H₅), 7.07-7-00 (m, 6H; *m*-C₆H₅), 1.92 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 132.8 (d, ²*J*(C,P) = 14.7 Hz; *o*-C₆H₅), 131.6 (d, ¹*J*(C,P) = 38.8 Hz; *ipso*-C₆H₅), 131.0 (d, ⁴*J*(C,P) = 1.5 Hz; *p*-C₆H₅), 129.2 (d, ³*J*(C,P) = 9.5 Hz; *m*-C₆H₅), 121.2 (*C*₅Me₅), 11.7 (C₅*Me*₅), the CF₃ carbon atom resonance was not detected. ³¹P{¹H} NMR (121 MHz, CDCl₃, 20 °C): δ 8.8 (s, PPh₃). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.9 (CF₃). Anal. Calcd for C₄₉H₆₃CuF₃N₄O₃PSTi₃ (M_w = 1083.24): C 54.33, H 5.86, N 5.17, S 2.96. Found: C 54.17, H 6.11, N 4.92, S 3.01.

Synthesis of [(Ph₃P)Ag{(µ₃-NH)₃Ti₃(η⁵-C₅Me₅)₃(µ₃-N)}][O₃SCF₃] (13). A 100 mL amber stained Schlenk flask was charged with **3** (0.15 g, 0.17 mmol), PPh₃ (0.050 g, 0.19 mmol) and toluene (20 mL). After stirring at room temperature for 18 h, the volatile components were removed under reduced pressure, and the resultant solid was washed with hexane (15 mL) to afford 13.0.5C₇H₈ as a yellow greenish solid (0.12 g, 60%). IR (KBr, cm⁻¹): \tilde{v} 3356 (w), 3291 (m), 3069 (w), 3043 (w), 2908 (s), 2858 (m), 1603 (w), 1585 (w), 1571 (w), 1481 (m), 1436 (s), 1379 (m), 1277 (vs), 1259 (vs), 1223 (s), 1147 (vs), 1097 (m), 1030 (vs), 999 (w), 761 (m), 749 (s), 707 (s), 696 (s), 654 (vs), 636 (vs), 572 (w), 516 (s), 511(s), 496 (m), 478 (w), 433 (m), 405 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 12.38 (s broad, 3H; NH), 7.53-7.40 (m, 9H; o- and p-C₆H₅), 7.16-7.08 (m, 6H; m-C₆H₅), 1.98 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 133.2 (dd, ²J(C,P) = 16.4 Hz, ³J(C,Ag) = 2.8 Hz; $o-C_6H_5$), 131.4 (d, ${}^{4}J(C,P) = 1.8$ Hz; $p-C_6H_5$), 131.0 (dd, ${}^{1}J(C,P) = 37.0$ Hz, ${}^{2}J(C,Ag) =$ 3.7 Hz; *ipso*-C₆H₅), 129.3 (d, ${}^{3}J(C,P) = 10.5$ Hz; *m*-C₆H₅), 121.3 (C₅Me₅), 11.8 (C₅Me₅), the CF₃ carbon atom resonance was not detected. ³¹P{¹H} NMR (202 MHz, CDCl₃, 20 °C): δ 21.0 (dd, ¹*J*(P,¹⁰⁹Ag) = 698 Hz, ¹*J*(P,¹⁰⁷Ag) = 604 Hz; PPh₃). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.9 (CF₃). Anal. Calcd for C_{52.5}H₆₇AgF₃N₄O₃PSTi₃ ($M_w = 1173.64$): C 53.73, H 5.75, N 4.77, S 2.73. Found: C 53.61, H 5.41, N 4.47, S 2.44.

Synthesis of $[(dppm)Cu\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ (14). In a fashion similar to the preparation of 6, the treatment of $2 \cdot C_7H_8$ (0.30 g, 0.33 mmol) with PPh₂CH₂PPh₂ (0.13 g, 0.34 mmol) in toluene (40 mL) for 20 h afforded 14.0.5C₇H₈ as a

yellow solid (0.33 g, 80%). IR (KBr, cm⁻¹): \tilde{v} 3352 (m), 3289 (m), 3055 (w), 2912 (s), 2859 (m), 1604 (w), 1586 (w), 1574 (w), 1482 (m), 1434 (s), 1379 (s), 1278 (s), 1263 (vs), 1223 (s), 1146 (vs), 1099 (m), 1031 (vs), 998 (w), 778 (m), 742 (vs), 694 (s), 647 (vs), 636 (vs), 571 (w), 516 (s), 476 (m), 434 (m), 406 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.65 (s broad, 3H; NH), 7.31-7.09 (m, 20H; C₆H₅), 2.81 (dd, ²*J*(H,P) = 6.6 Hz, ²*J*(H,P) = 6.6 Hz, 2H; CH₂), 1.96 (s, 45H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 132.3 (d broad, ²*J*(C,P) = 17.6 Hz; *o*-C₆H₅), 130.2 (s broad, *p*-C₆H₅), 128.8 (d broad, ³*J*(C,P) = 8.8 Hz; *m*-C₆H₅), 121.2 (*C*₅Me₅), 29.0 (m broad; CH₂), 11.8 (C₅*Me*₅), the CF₃ and C-*ipso* of C₆H₅ carbon atom resonances were not detected. ³¹P{¹H} NMR (202 MHz, CDCl₃, 20 °C): δ 2.7 (broad; Cu-PPh₂-CH₂-PPh₂), -24.1 (broad; Cu-PPh₂-CH₂-PPh₂), -26.1 (d, ²*J*(P,P) = 150.6 Hz; Cu-PPh₂-CH₂-PPh₂). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.9 (CF₃). Anal. Calcd for C_{59,5}H₇₄CuF₃N₄O₃P₂STi₃ (*M*_w = 1251.42): C 57.11, H 5.96, N 4.48, S 2.56. Found: C 57.09, H 5.82, N 4.22, S 2.44.

Synthesis of $[(dppm)Ag\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]$ (15). In a fashion similar to the preparation of 7, the treatment of 3 (0.15 g, 0.17 mmol) with PPh₂CH₂PPh₂ (0.067 g, 0.17 mmol) in toluene (15 mL) for 18 h gave a yellow solid. The solid was washed with hexane (10 mL) to afford 15 as a yellow solid (0.16 g, 76%). IR (KBr, cm⁻¹): $\tilde{\nu}$ 3352 (m), 3299 (m), 3054 (w), 2910 (s), 2859 (m), 1586 (w), 1571 (w), 1482 (m), 1436 (s), 1380 (m), 1279 (vs), 1258 (vs), 1222 (m), 1148 (vs), 1101 (m), 1031 (vs), 999 (w), 774 (m), 742 (vs), 713 (s), 695 (s), 660 (vs), 636 (vs), 571 (w), 516 (m), 478 (m), 430 (m), 404 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 12.32 (s broad, 3H; NH), 7.35-7.09 (m, 20H; C₆H₅), 2.83 (dt, ³J(H,Ag) = 6.0 Hz, ²J(H,P) = 6.0 Hz, 2H; CH₂), 1.99 (s, 45H; C₅Me₅).

¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 134.3 (m; *ipso*-C₆H₅), 132.4 (m; *o*-C₆H₅), 130.3 (s; *p*-C₆H₅), 128.9 (m; *m*-C₆H₅), 121.1 (*C*₅Me₅), 28.2 (m broad; CH₂), 11.9 (C₅Me₅), the CF₃ carbon atom resonance was not detected. ³¹P{¹H} NMR (202 MHz, CDCl₃, 20 °C): δ - 2.9 (dd, *J*(P,¹⁰⁹Ag) = 352 Hz, J(P,¹⁰⁷Ag) = 305 Hz; Ag-PPh₂-CH₂-PPh₂). ³¹P{¹H} NMR (202 MHz, CD₂Cl₂, -100 °C): δ 12.2 (d broad, ¹*J*(P,Ag) = 592 Hz; Ag-PPh₂-CH₂-PPh₂), - 22.1 (broad, Ag-PPh₂-CH₂-PPh₂). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.9 (CF₃). Anal. Calcd for C₅₆H₇₀AgF₃N₄O₃P₂STi₃ (*M_w* = 1249.67): C 53.82, H 5.64, N 4.48, S 2.56. Found: C 53.93, H 5.56, N 4.76, S 2.42.

Reaction of 14 with 2 in a NMR Tube-Scale Experiment. A 5 mm valved NMR tube was charged with 14 (0.008 g, 0.006 mmol), $2 \cdot C_7H_8$ (0.006 g, 0.006 mmol) and chloroform-d₁ (1.00 mL). Spectra taken after 10 min at room temperature showed resonance signals due to $[{Cu(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}_2(\mu-dppm)][O_3SCF_3]_2$ (16) (ca. 60 %) and those due to the starting materials. This mixture did not change upon standing at room temperature for 1 day. After addition of excess of $2 \cdot C_7H_8$ (0.002 g, 0.002 mmol), the spectra revealed complete consumption of 14 and resonances due to 16, toluene and the corresponding excess of 2. Complex 16 was characterized by ¹H and ¹³C{¹H} NMR spectroscopy: ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.62 (s broad, 6H; NH), 7.41 (m, 4H; *p*-C₆H₅), 7.28 (m, 8H; *o*-C₆H₅), 6.92 (m, 8H; *m*-C₆H₅), 3.33 (t, ²*J*(H,P) = 5.0 Hz, 2H; CH₂), 1.88 (s, 90H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 1132.6 (d, ²*J*(C,P) = 14.6 Hz; *o*-C₆H₅), 132.0 (d, ¹*J*(C,P) = 38.1 Hz; *ipso*-C₆H₅), 130.6 (s; *p*-C₆H₅), 129.0 (d, ³*J*(C,P) = 11.0 Hz; *m*-C₆H₅), 121.3 (*C*₅Me₅), 23.7 (m broad; CH₂), 11.8 (C₅Me₅), the CF₃ carbon atom resonance was not detected.

Synthesis of $[{Ag(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}_2(\mu-dppm)][O_3SCF_3]_2$ (17). A 100 mL amber stained Schlenk flask was charged with **3** (0.20 g, 0.23 mmol), PPh₂CH₂PPh₂ (0.045 g, 0.12 mmol) and toluene (15 mL). The reaction mixture was stirred for 15 h at room temperature and the volatile components were removed under reduced pressure. The resultant solid was washed with hexane (10 mL) and vacuum-dried to give 17. C₇H₈ as a yellow solid (0.15 g, 60%). IR (KBr, cm⁻¹): \tilde{v} 3349 (m), 3296 (m), 3054 (w), 2910 (s), 2859 (m), 1603 (w), 1586 (w), 1572 (w), 1485 (m), 1435 (s), 1379 (s), 1276 (vs), 1259 (vs), 1222 (s), 1149 (vs), 1100 (m), 1030 (vs), 999 (w), 786 (m), 736 (vs), 694 (s), 656 (vs), 636 (vs), 571 (w), 516 (m), 478 (m), 429 (m), 404 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 12.19 (s broad, 6H; NH), 7.45 (m, 4H; p-C₆H₅), 7.32 (m, 8H; o-C₆H₅), 7.02 (m, 8H; m-C₆H₅), 3.52 (m broad, 2H; CH₂), 1.91 (s, 90H; C₅Me₅). ¹³C{¹H} NMR (125 MHz, CDCl₃, 20 °C): $\delta 132.7$ (d, ${}^{2}J(C,P) = 15.1$ Hz; o-C₆H₅), 131.1 (s; p-C₆H₅), 130.8 (d, ${}^{1}J(C,P) = 34.4$ Hz; *ipso*-C₆H₅), 129.1 (d, ${}^{3}J(C,P) = 10.4$ Hz; *m*-C₆H₅), 121.1 (C₅Me₅), 121.1 (g, ${}^{1}J(C,F) = 322$ Hz; CF₃), 23.2 (m broad; CH₂), 11.8 (C₅Me₅). ³¹P{¹H} NMR (202 MHz, CDCl₃, 20 °C): 3.1 (m, ${}^{1}J(P,Ag) \approx 670$ Hz; Ag-PPh₂-CH₂-PPh₂-Ag). ${}^{19}F$ NMR (282 MHz, CDCl₃, 20 °C): δ -77.7 (CF₃). Anal. Calcd for C₉₄H₁₂₆Ag₂F₆N₈O₆P₂S₂Ti₆ ($M_w = 2207.09$): C 51.15, H 5.75, N 5.08, S 2.90. Found: C 50.81, H 5.78, N 4.79, S 2.67.

Reaction of 2 with dppe in a NMR Tube-Scale Experiment. A 5 mm valved NMR tube was charged with $2 \cdot C_7H_8$ (0.009 g, 0.010 mmol), PPh₂CH₂CH₂PPh₂ (0.002 g, 0.005 mmol) and chloroform-d₁ (1.00 mL). Spectra taken after 10 min at room temperature showed resonance signals due to [{Cu(μ_3 -NH)₃Ti₃(η^5 -C₅Me₅)₃(μ_3 -N)}₂(μ -dppe)][O₃SCF₃]₂ (18) (ca. 75 %) and those due to the starting materials. This mixture did not change upon standing at room temperature for 1 day. After addition of excess of $2 \cdot C_7H_8$ (0.003 g, 0.003

mmol), the spectra revealed complete consumption of free dppe and resonances due to **18**, toluene and the corresponding excess of **2**. Complex **18** was characterized by ¹H and ¹³C{¹H} NMR spectroscopy: ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 11.56 (s broad, 6H; NH), 7.55 (m broad, 12H; *o*- and *p*-C₆H₅), 7.26-7.07 (m, 8H; *m*-C₆H₅), 1.86 (s, 90H; C₅Me₅), 1.72 (m broad, 4H; CH₂CH₂). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 132.2 (m; *o*-C₆H₅), 131.8 (d, ¹*J*(C,P) = 35.9 Hz; *ipso*-C₆H₅), 131.2 (s; *p*-C₆H₅), 129.7 (m; *m*-C₆H₅), 121.2 (*C*₅Me₅), 23.0 (m broad; CH₂CH₂), 11.8 (C₅Me₅), the CF₃ carbon atom resonance was not detected.

Synthesis of $[{Ag(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}_2(\mu-dppe)][O_3SCF_3]_2$ (19). In a fashion similar to the preparation of 17, treatment of 3 (0.15 g, 0.17 mmol) with PPh₂CH₂CH₂PPh₂ (0.035 g, 0.09 mmol) in toluene (15 mL) gave $19 \cdot C_7 H_8$ as an orange solid (0.14 g, 74%). IR (KBr, cm⁻¹): \tilde{v} 3356 (m), 3304 (m), 3054 (w), 2910 (s), 2859 (m), 1603 (w), 1586 (w), 1571 (w), 1485 (m), 1452 (m), 1435 (s), 1379 (m), 1263 (vs), 1222 (s), 1148 (vs), 1100 (m), 1070 (w), 1030 (vs), 999 (w), 884 (w), 794 (m), 738 (vs), 696 (s), 663 (vs), 655 (vs), 636 (vs), 571 (w), 515 (s), 479 (m), 464 (w), 431 (m), 405 (m). ¹H NMR (300 MHz, CDCl₃, 20 °C): δ 12.47 (s broad, 6H; NH), 7.45-7.01 (m, 20H; C₆H₅), 2.02 (m broad, 4H; CH₂CH₂), 1.95 (s, 90H; C₅Me₅). ¹³C{¹H} NMR (75 MHz, CDCl₃, 20 °C): δ 132.5 (m, ²J(C,P) = 13.4 Hz; $o-C_6H_5$), 131.0 (s; $p-C_6H_5$), 129.2 (d, ${}^{3}J(C,P) = 9.8$ Hz; $m-C_6H_5$), 120.9 (C_5Me_5), 23.5 (m broad; CH₂CH₂), 11.8 (C₅Me₅), the CF₃ and C-ipso of C₆H₅ carbon atom resonances were not detected. ³¹P{¹H} NMR (121 MHz, CDCl₃, 20 °C): 15.7 (m, ¹J(P,Ag) \approx 660 Hz; Ag-PPh₂-CH₂-PPh₂-Ag). ¹⁹F NMR (282 MHz, CDCl₃, 20 °C): δ -77.6 (CF₃). Anal. Calcd for $C_{95}H_{128}Ag_2F_6N_8O_6P_2S_2Ti_6$ ($M_w = 2221.11$): C 51.37, H 5.81, N 5.04, S 2.89. Found: C 51.56, H 5.62, N 5.32, S 2.79.

X-ray structure determination of 4, 5, 10, 14, 15, and 18. Crystals of complexes 4, 5, 10, 14, 15, and 18 were grown as described in the Results and Discussion section, removed from the Schlenk flasks and covered with a layer of a viscous perfluoropolyether (Fomblin®Y). A suitable crystal was selected with the aid of a microscope, mounted on a cryoloop, and immediately placed in the low temperature nitrogen stream of the diffractometer. The intensity data sets were collected at 100K for complex 10 or 200K for the rest on a Bruker-Nonius KappaCCD diffractometer equipped with an Oxford Cryostream 700 unit. Crystallographic data for all the complexes are presented in Table 1 (see page 45).

The structures were solved, using the WINGX package,¹⁸ by direct methods (SHELXS-97) and refined by least-squares against F^2 (SHELXL-97).¹⁹ Anion CF₃SO₃⁻ presented disorder in most of the structures, and this disorder was treated conventionally by using the PART tool of the SHELXL-97 program and allowing free refinement of the occupancy factors with the FVAR command. Complexes **4** and **5** crystallized with half a molecule of toluene, and both of them presented disorder for the atoms C(1), F(1), F(2), F(3), O(1), O(2), O(3) and S(1) of the triflate anions. The final values of occupancy were 51 and 49% for **4**, and 52 and 48% for **5**. For compound **5**, DELU and SIMU restraints were also employed for the triflate anion. All non-hydrogen atoms for these compounds were anisotropically refined. The hydrogen atoms were positioned geometrically and refined using a riding model, except for those of the imido NH and ammonia ligands in complex **4**, which were located in the difference Fourier map and refined isotropically. The atoms of the toluene molecules in both compounds were restrained with DELU instructions.

Complex 10 crystallized with one molecule of fluorobenzene. Several attempts were made to model the solvent molecule but all were unsuccessful, therefore the Squeeze²⁰ procedure was applied to remove its contribution to the structure factors. In addition to the disorder for the atoms C(6), F(1), F(2), F(3), O(1), O(2), O(3), and S(1) of the triflate anion, crystals of compound 10 presented disorder for the carbon atoms C(21)-C(30) of the pentamethylcyclopentadienyl group linked to Ti(2), and for *tert*-butyl moiety of CNtBu(C(2), C(3), C(4) and C(5)). These disorders were also treated by using the PART tool. The final values were 52.5 and 47.5% for the triflate anion, 55.2 and 44.8% for the pentamethylcyclopentadienyl group, and 53.1 and 46.9% for the *tert*-butyl group. Moreover the triflato anion was restrained with SADI and DFIX instructions. All non-hydrogen atoms for 10 were anisotropically refined, except most of the atoms for the disordered pentamethylcyclopentadienyl group (C(21)-C(25), C(28)-C(30), C(21)'-C(26)', and C(28)'-C(30)), and atoms F(2), O(1), F(2)' and O(1)' for the triflate anion, which could only be refined isotropically. The hydrogen atoms were positioned geometrically and refined using a riding model.

In the crystallographic study of compound **14**, a molecule of hexane was found in the difference Fourier map, but it was not possible to get a chemical sensible model for it, so Squeeze²⁰ procedure was used to remove its contribution to the structure factors. All the non-hydrogen atoms were refined anisotropically. All the hydrogen atoms were positioned geometrically and refined by using a riding model. DFIX and DELU restraints were used for the triflate anion, while the carbon atoms of the phenyl groups were also restrained with DELU instruction.

On the other hand, crystals of **15** presented disorder for the atoms C(2), F(1), F(2), F(3), O(1), O(2), O(3) and S(1) of the anion triflate, and for the carbon atoms C(31)-C(40)

of the pentamethylcyclopentadienyl group linked to Ti(3). The PART tool was used to model both disorders. The final values were 54.4 and 45.6% for the triflate anion, and 51 and 49% for the pentamethylcyclopentadienyl group. Moreover SADI and DFIX instructions were employed to restrain the triflate anion. All non-hydrogen atoms were refined anisotropically, except C(36) and C(36)', which were refined isotropically. All the hydrogen atoms were positioned geometrically and refined using a riding model.

Finally, compound **18** crystallized with two molecules of dichloromethane, and presented disorder for the atoms C(81), Cl(1), and Cl(2) of the solvent molecules. The treatment of this disorder, by using the PART tool, allowed two positions for each atom to be refined with 70.1 and 29.9% of occupancy, respectively. SADI restraints were also employed for these solvent molecules. The triflate anion was restrained with DFIX and SADI instructions. All non-hydrogen atoms were refined anisotropically, except C(81)', which was refined isotropically. The imido group hydrogen atoms were located in the difference Fourier map and refined isotropically, while the rest were positioned geometrically and refined using a riding model.

Results and Discussion

The treatment of $[{Ti(\eta^5-C_5Me_5)(\mu-NH)}_3(\mu_3-N)]$ (1) with 0.5 equiv of $[{Cu(O_3SCF_3)}_2 \cdot C_7H_8]$ or 1 equiv of $[Ag(O_3SCF_3)]$ in dichloromethane at room temperature affords the single-cube complexes $[(CF_3SO_2O)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}]$ (M = Cu (2),¹⁵ Ag (3)¹⁶) as orange or yellow solids in good yields (Scheme 1). Whereas complex 3 reacts with an additional equivalent of 1 to give the corner-shared double-cube ionic complex $[Ag{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}_2][O_3SCF_3]$,¹⁶ a product with a metalloligand to copper ratio of 2:1 could not be obtained by addition of excess 1 to complex 2. It appears that the steric bulk of the metalloligand blocks the formation of a six-coordinate copper complex.

Scheme 1. Reactions of 2 and 3 with ammonia.

Despite many attempts we were not able to grow suitable single crystals of **2** and **3** for an X-ray crystal structure determination. However, toluene solutions of the complexes at -20 °C rendered small fractions of orange crystals of the ammonia adducts $[(H_3N)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}][O_3SCF_3]\cdot 0.5C_7H_8$ (M = Cu (4·0.5C_7H_8), Ag (5·0.5C_7H_8)). We suggest that the partial hydrolysis of complexes **2** and **3** could generate NH₃ in the solution

and this ammonia reacts with the remaining molecules of 2 and 3 to give the final adducts. Indeed, compounds 4 and 5 were obtained in 77 and 50% yield respectively by treatment of 2 and 3 with excess of ammonia in toluene at room temperature. The IR (KBr) spectra of compounds 4 and 5 show several bands in the v_{NH} region, between 3383 and 3183 cm⁻¹, for the imido NH and NH₃ ligands. In addition, the IR spectra of 4 and 5 reveal one absorption at 1620 and 1617 cm⁻¹ respectively, assignable to the NH₃ bending mode.^{21,22} ¹H and ¹³C{¹H} NMR spectra in chloroform-d₁ at room temperature show resonances for equivalent NH and η^5 -C₅Me₅ groups. The NH resonance signals ($\delta = 11.71$ and 12.33) are similar to those found in the ¹H NMR spectra of complexes 2 and 3 ($\delta = 11.49$ and 12.25) and appear shifted toward higher field than that found for 1 ($\delta = 13.40$). The resonance signals for the C₅Me₅ groups ($\delta = 120.2$ and 120.8) in the ¹³C{¹H} NMR spectra of compounds 4 and 5 are also comparable to those reported for complexes 2 and 3 ($\delta = 120.2$ and 120.6) and are shifted downfield with respect to that found for 1 ($\delta = 117.1$). These shifts are consistent with a tridentate chelate coordination of the basal NH groups to the copper or silver centers. ¹H NMR spectra of 4 and 5 reveal also one broad resonance for the ammine ligands at $\delta = 2.12$ and 1.94, respectively.

The X-ray crystal structures of **4** and **5** are presented in Figures 1 and 2, and selected distances and angles for both compounds are given in Table 2. Both compounds crystallize with a half molecule of toluene solvent per complex, and exhibit similar unit cell dimensions (see Table 1). The solid-state structures contain two $[(H_3N)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}]$ cube-type cations associated through hydrogen bonding interactions between the ammine ligands and one oxygen atom of each trifluoromethanesulfonate anion.²³

Table 2. Selected Lengths (Å) and Angles (deg) for 4 and 5.

Within each cube-type cation, the metalloligand coordinates to the copper or silver centers in a tridentate chelate fashion with Cu-N bond lengths in the range 2.089(2)-2.157(2) Å and Ag-N distances spanning 2.371(3)-2.503(3) Å. These bond lengths and the N-M-N angles (average = 91.4(6)° for M = Cu; average = 79(1)° for M = Ag) are similar to those reported for four-coordinate Cu^I/Ag^I ions with tris(pyrazolyl)methane ligands.⁵ The distorted tetrahedral geometry around copper or silver is completed by one ammine ligand showing a M-N(2) bond length (1.989(2) or 2.190(4) Å, respectively) similar to those found in other

copper(I)- or silver(I)-ammonia complexes.^{22a,24} The ammine ligand is significantly tilted (N(2)-Cu-N angles range from 114.8(1) to 138.0(1)° and N(2)-Ag-N angles vary from 121.1(1) to 150.0(1)°) with respect to the pseudo- C_3 axis that crosses the μ_3 -N nitrido apical ligand and the group 11 metal. This distortion could be due to the hydrogen bonding interactions between the ammonia and the trifluoromethanesulfonate groups. Table 3 shows representative N(2)····O(1) distances for both complexes, and relevant H···O(1) distances found for the ammine located hydrogen atoms in **4**.

^{*a*}Data for the two positions of the disordered triflate anion. Symmetry transformations: (a) – x + 1/2, -y + 3/2, -z. A = acceptor; D = donor. Symmetry operators apply to acceptor atoms.

Complexes 2 and 3 also react with one equivalent of pyridine (py), 2,6dimethylphenylisocyanide (CNAr), *tert*-butylisocyanide (CN*t*Bu) or triphenylphosphane in toluene at room temperature to give the analogous adducts $[(L)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}][O_3SCF_3]$ (L = py, M = Cu (6), Ag (7); L= CNAr, M = Cu (8), Ag (9); L = CN*t*Bu, M = Cu (10), Ag (11); L = PPh₃, M = Cu (12), Ag (13)) in good yields (60-90%) (Scheme 2). No stable compounds were isolated on the reactions of complexes 2 and 3 with other potential ligands such as COD, PhCCH, MeCN or THF; being the starting materials always recovered from the reaction mixtures. Copper(I) complexes were obtained as air sensitive orange, green or yellow solids whereas silver(I) derivatives are air and light sensitive yellow or green solids and their syntheses and manipulations were carried out in the dark. Compounds **6-13** are poorly soluble in toluene or benzene but exhibit a good solubility in chloroform or dichloromethane. NMR experiments in chloroform-d₁ reveal that addition of triphenylphosphane to complexes **4-11** immediately displaces NH₃, py or CNR ligands from the coordination sphere of the copper and silver centers to form complexes **12** or **13**.

Scheme 2. Synthesis of complexes 6-13

Compounds 6-13 were characterized by spectral and analytical techniques, as well as by an X-ray crystallographic determination for $10 \cdot C_6H_5F$ obtained by diffusion of hexane into a saturated solution of 10 in fluorobenzene. IR spectra (KBr) of complexes 6-13 show two v_{NH} vibrations, between 3364 and 3282 cm⁻¹, in a similar range to the value determined for 1,¹⁰ 3352 cm⁻¹. Compounds 8 and 9 reveal v(CN) stretching vibrations of the 2,6dimethylphenylisocyanide ligands at 2160 and 2177 cm⁻¹, respectively, whereas complexes 10 and 11 reveal v(CN) stretching vibrations of the *tert*-butylisocyanide ligands at 2185 and 2202 cm⁻¹, respectively. Those values are higher than those found for the free 2,6dimethylphenylisocyanide (2122 cm⁻¹) or *tert*-butylisocyanide (2138 cm⁻¹), indicating predominantly σ -type M-CNR interactions.^{5h,25,26,27} The CN stretching vibration in complex **11** is at the same value of 2202 cm⁻¹ for the analogue silver derivative [(*t*BuNC)Ag{HC(3-*t*Bupz)₃}](O₃SCF₃),^{5b} suggesting a similar donor character between the metalloligand **1** and the tris(3-*tert*-butylpyrazolyl)methane.

¹H and ¹³C{¹H} NMR spectra in chloroform-d₁ of complexes **6-13** at room temperature show resonances for equivalent NH and η^5 -C₅Me₅ groups and are consistent with a *C*_{3v} symmetry in solution. In addition, the spectra reveal resonance signals for one pyridine, 2,6-dimethylphenylisocyanide, *tert*-butylisocyanide, or triphenylphosphane ligands coordinated to the copper(1) or silver(1) centers. The ¹³C{¹H} NMR spectra of compounds **8** and **9** display resonances at $\delta = 148$. 2 and 148.9 respectively, which can be assigned to the CN carbon of the 2,6-dimethylphenylisocyanide ligands.²⁸ Analogous resonance signals at $\delta = 135.0$ and 139.9 in the ¹³C{¹H} NMR spectra of complexes **10** and **11** were determined for the coordinated *tert*-butylisocyanide groups.^{3i,3k} Those values are clearly shifted to higher field compared to those of the free 2,6-dimethylphenylisocyanide and *tert*-butylisocyanide ($\delta = 167.5$ and 152.3, respectively), which has been attributed to an essentially σ -donor character of the isocyanide ligands.^{28,29}

³¹P{¹H} NMR spectra in chloroform-d₁ at room temperature of compounds **12** and **13** reveal resonance signals at $\delta = 8.8$ (s) and 21.0 (dd) shifted downfield with respect to that found for free PPh₃ ($\delta = -5.5$ ppm). The ³¹P{¹H} NMR spectrum of the silver compound **13** at room temperature show a well-resolved pair of doublets with coupling constants ¹*J*(P,¹⁰⁹Ag) = 698 Hz and ¹*J*(P,¹⁰⁷Ag) = 604 Hz, typical for complexes containing silver centers bonded to only one phosphorus atom.^{27,30,31} The ratio of ¹*J*(P,¹⁰⁹Ag)/¹*J*(P,¹⁰⁷Ag) = 1.156 is consistent with the theoretical ratio of $\gamma(^{109}Ag)/\gamma(^{107}Ag)=1.149.^{30}$

The X-ray crystal structure of 10 is presented in Figure 3, while selected lengths and angles are given in Table 4. Compound 10 crystallizes with one fluorobenzene solvent molecule per ionic complex. The cation structure shows a cube-type [CuTi₃N₄] core with angles M-N-M and N-M-N in the range 83.2(1)-101.4(1)°. The coordination sphere about the copper atom is best described as distorted tetrahedral, comprising three nitrogen atoms of the tridentate organometallic ligand { $(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)$ } and the *sp*-carbon atom of the CNtBu group, with N-Cu-N angles of average 91.3(3)° and N-Cu-C(1) angles spanning 112.8(1)-130.1(2)°. The copper-nitrogen bond lengths vary from 2.099(3) to 2.156(3) Å (average 2.12(3) Å) and are very similar to those found in the crystal structure of compound **4** and are slightly longer than those reported for several tris(pyrazolyl)methane complexes, where the copper atom is also coordinated to three nitrogen atoms.⁵ The distance from the *sp*-carbon atom C(1) of CN*t*Bu to the copper atom of 1.861(4) Å is somewhat longer than that found for other isocyanide copper(I) complexes, such as $[(1,4-CNC_6H_4NC)Cu\{HC(3,5 Me_2pz_{3}$ [BF₄] (1.819(5) Å)^{5h} and [(*t*BuNC)Cu{HB(3,5-(CF_3)_2pz)_3}] (1.827(6) Å)³ⁱ. The isocyanide ligand in **10** is slightly bent with a Cu-C(1)-N(2) angle of 171.9(4)° and possesses a normal C=N bond distance (1.144(5) Å).³² Within the organometallic ligand, the average bond lengths and angles are similar to those determined in the free ligand 1.9

Figure 3. Perspective view of the cation in 10 with thermal ellipsoids at the 50% probability level. Hydrogen atoms are omitted for clarity.

The reactions of 2 and 3 with bisphosphanes $Ph_2P-(CH_2)_n-PPh_2$ (n = 1, 2) in different molar ratios have been also studied (Scheme 3). Treatment of 2 and 3 with one equivalent of methylenebis(diphenylphosphane) (dppm) in toluene at room temperature led to the expected 1:1 adducts $[(dppm)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}][O_3SCF_3]$ (M = Cu (14), Ag (15)) as yellow solids in good yields (80 and 76%). The analogous reaction of 3 with a half equivalent of dppm gave the bisphosphane-bridged double-cube complex [{Ag(μ_3 -NH)₃Ti₃(η^5 -C₅Me₅)₃(μ_3 -N)}₂(μ -dppm)][O₃SCF₃]₂ (17). Compound 17·C₇H₈ was isolated as a yellow solid in 60% yield in a pure form according to analytical data and NMR spectroscopy in chloroform-d₁. However, the analogous treatment of the copper derivative 2 with 0.5 equiv of dppm gave a solid containing a mixture of complexes [{Cu(μ_3 - $NH_{3}Ti_{3}(\eta^{5}-C_{5}Me_{5})_{3}(\mu_{3}-N)_{2}(\mu-dppm)][O_{3}SCF_{3}]_{2}$ (16), 2 and 14, according to NMR spectroscopy in chloroform-d₁. A similar mixture of compounds was obtained when in a NMR tube experiment complex 14 was treated with one equivalent of 2. However, addition of a slight excess of 2 to this solution produced complete consumption of 14 allowing the characterization of **16** by ¹H and ¹³C{¹H} NMR spectroscopy.

Scheme 3. Reactions of 2 and 3 with bisphosphanes.

Treatment of the silver compound **3** with a half equivalent of ethane-1,2diylbis(diphenylphosphane) (dppe) in toluene at room temperature afforded the doublecube complex [{Ag(μ_3 -NH)_3Ti_3(η^5 -C₅Me₅)₃(μ_3 -N)}₂(μ -dppe)][O_3SCF_3]₂ (**19**) as an orange solid in 74% yield. However, the analogous reaction of the copper derivative **2** with dppe gave a solid containing a mixture of [{Cu(μ_3 -NH)_3Ti_3(η^5 -C₅Me₅)₃(μ_3 -N)}₂(μ dppe)][O_3SCF_3]₂ (**18**) (ca. 75%) and the starting reagents, according to ¹H NMR spectroscopy in chloroform-d₁. Fortunately, crystallization in dichloromethane/hexane at room temperature gave suitable crystals for X-ray diffraction of **18**·2CH₂Cl₂, although in low yield. NMR analysis of the crystals in chloroform-d₁ revealed a mixture of **18**, **2** and dppe, indicating the partial dissociation of complex **18** in solution. Upon addition of excess of **2** to this solution, the spectra revealed complete consumption of free dppe allowing the characterization of **18** by ¹H and ¹³C{¹H} NMR spectroscopy. The decreased stability of double-cube complexes **16** and **18** when compared with the silver analogues **17** and **19** could be related with steric factors about the smaller copper(I) cation.

Compounds 14 and 15 were characterized by spectral and analytical methods, as well as by X-ray crystallographic determinations of crystals of $14 \cdot C_6H_{14}$ and 15 obtained by diffusion of hexane into solutions of 14 in dichloromethane or 15 in fluorobenzene. Spectroscopic data for 14 and 15 are similar to those of the triphenylphosphane derivatives 12 and 13. The methylene resonances of the dppm ligand in the ¹H NMR spectra appear as doublet of doublets at $\delta = 2.81 \ (^2J(H,P) = 6.6 \text{ Hz}, \ ^2J(H,P) = 6.6 \text{ Hz})$ for the copper complex 14 or as doublet of triplets at $\delta = 2.83 \ (^3J(H,Ag) = 6.0 \text{ Hz}, \ ^2J(H,P) = 6.0 \text{ Hz})$ for the silver compound 15. The ¹³C{¹H} NMR spectra show broad signals at $\delta = 29.0 \ (14)$ or 28.2 (15) for the CH₂ groups. These resonances are very close to those found in the ¹H and ¹³C{¹H} NMR spectra of free dppm ($\delta = 2.78$ and 28.0, respectively).

³¹P{¹H} NMR spectrum of **14** at room temperature in chloroform-d₁ revealed broad resonance signals for coordinated ($\delta = 2.7$) and free phosphorous in the dppm ligand ($\delta = -$ 24.1).³³ Upon cooling at -55 °C two doublets were observed with ²*J*(P,P) of ca. 150 Hz. These NMR data are consistent with a monodentate dppm ligand; in particular, the high field signal is close to that of the free dppm ligand ($\delta = -22.4$), confirming the presence of a dangling group. However, the breadth of the resonance signals at room temperature suggests the existence of an exchange process in solution. The ³¹P{¹H} NMR spectrum of the silver compound **15** at room temperature in chloroform-d₁ shows a well-resolved pair of doublets at $\delta = -2.9$ in a fashion similar to those observed in the spectrum of the triphenylphosphane silver(I) derivative **13**. However, the spectrum of **15** reveals silverphosphorus coupling constants, $J(P, {}^{109}Ag) = 352$ Hz and $J(P, {}^{107}Ag) = 305$ Hz, which are ca. the half of the values found for **13**, ${}^{1}J(P, {}^{109}Ag) = 698$ Hz and ${}^{1}J(P, {}^{107}Ag) = 604$ Hz.

To investigate the coordination mode of the dppm ligand to the silver center, we studied a dichloromethane-d₂ solution of **15** by low-temperature ${}^{31}P{}^{1}H$ NMR spectroscopy in a 500 MHz spectrometer. The room temperature ³¹P{¹H} NMR spectrum of complex 15 shows one well-resolved pair of doublets by coupling with the two isotopes of silver. The simplicity of these resonances rules out the possibility of forming a doublecube structure via two µ-dppm ligands since a more complicated spectra should be expected (vide infra for complexes 17 and 19). When cooled to -30 °C, the resonances began to broaden and, at -100 °C, gave two broad resonances at $\delta = 12.2$ (d, ¹*J*(P,Ag) ≈ 592 Hz) and $\delta = -22.1$ which coalesced at -80 °C. This nonequivalence of the phosphorus atoms in 15 at low temperature is similar to that observed in the NMR spectra of copper complex 14 at room temperature and is consistent with a monodentate coordination of the dppm ligand to the metal center as determined in the solid-state structures of 14 and 15 (vide infra). Fluxionality involving unidentate dppm ligands has ample precedents in the literature,³⁴ where an intramolecular end-over-end exchange of coordinated and free phosphorous has been proposed. This also would account for the value of the coupling constants J(P,Ag) in the fast-exchange limit being the mean of ${}^{1}J(P,Ag)$ and ${}^{3}J(P,Ag)$.³³

The X-ray diffraction studies of 14 and 15 showed similar structures for the cationic moiety. The cation of compound 15 is presented in Figure 4, while selected lengths and angles for both complexes 14 and 15 are given in Table 5. While 15 crystallizes as a solvent-free compound, crystals of 14 bear one hexane solvent molecule per ionic compound. The structures confirm the azaheterometallocubane cores [MTi₃N₄] of the

cationic fragments and the tridentate coordination of the metalloligand to the group 11 metals. The geometry about the copper or silver centers is best described as distorted tetrahedral, with angles of N-M-N = 90.6(4)° av. (Cu), or 79.5(3)° av. (Ag) and N-M-P(1) spanning 117.0(1)-137.5(1)° (Cu), or 129.1(1)-134.3(1)° (Ag). The copper-nitrogen bond distances in **14** range 2.105(3)-2.168(3) Å and are analogous to those determined in the structures of **4** and **10**. On the other hand, the silver-nitrogen bond lengths in **15** range 2.422(3)-2.469(3) Å and are similar to those found for **5**, and slightly longer than those reported for silver tris(pyrazolyl)methane compounds.⁵ The M-P(1) bond length (2.205(1) and 2.369(1) Å for copper and silver, respectively) are clearly shorter than M···P(2) distances (3.921(2) Å, Cu; and 4.054(1) Å, Ag), accordingly to a monodentate dppm ligand coordination. The group 11 metal-phosphorous bond lengths are similar to those reported for analogous complexes with triphenylphosphane ligands, such as [(Ph₃P)Cu{HC(3-Phpz)₃][[NO₃]³⁵ or [(Ph₃P)M{HB(3,5-Me₂pz)₃]] (M = Cu, Ag).³⁶

Figure 4. Perspective view of the cation in complex **15** with thermal ellipsoids at the 50% probability level. Methyl groups of the pentamethylcyclopentadienyl ligands and hydrogen atoms are omitted for clarity.

Table 5. Selected Lengths (Å) and Angles (deg) for 14 and 15.

Silver compounds **17** and **19** were characterized by spectral and analytical methods, while the analogous double-cube copper derivatives **16** and **18** could be only characterized by ¹H and ¹³C{¹H} NMR spectroscopy, as well as by an X-ray crystal structure determination for **18**·2CH₂Cl₂. ¹H and ¹³C{¹H} NMR spectra of complexes **16-19** in chloroform-d₁ reveal resonances for equivalent NH and η^5 -C₅Me₅ groups. In addition, the spectra show resonance signals for one dppm or dppe ligand per two {M(µ₃-NH)₃Ti₃(η^5 - $C_5Me_5)_3(\mu_3-N)$ moieties. The methylene resonances of the dppm ligand in the ¹H NMR spectra appear as a triplet at $\delta = 3.33$ (²*J*(H,P) = 5.0 Hz) for **16** or a multiplet centered at $\delta = 3.52$ for the silver compound **17**, clearly shifted downfield with respect to those found in complexes **14** and **15** ($\delta = 2.81$ and 2.83, respectively) and free dppm ($\delta = 2.78$). However, the resonances for the CH₂ groups, $\delta = 23.7$ (**16**) and 23.2 (**17**), in the ¹³C{¹H} NMR spectra are shifted upfield when compared with those observed in the spectra of **14** ($\delta = 29.0$), **15** ($\delta = 28.2$), and free dppm ($\delta = 28.0$). On the other hand, the ethylene resonances of the dppe ligand in the ¹H and ¹³C{¹H} NMR spectra of complexes **18** and **19** appear as broad signals at chemical shifts ($\delta_H = 1.72$ and 2.02, $\delta_C = 23.0$ and 23.5) close to those of free dppe ($\delta_H = 2.07$, $\delta_C = 23.8$).

The ³¹P{¹H} NMR spectra in chloroform-d₁ at room temperature of the silver compounds **17** and **19** consist of a multiplet resonances centered at $\delta = 3.1$ and 15.7, respectively, which are shifted downfield with respect to that found for free dppm ($\delta = -22.4$) and dppe ($\delta = -12.6$). The complex spectral pattern for these compounds is due to overlapping spectra of isotopomers containing ¹⁰⁹Ag¹⁰⁹Ag, ¹⁰⁹Ag¹⁰⁷Ag, and ¹⁰⁷Ag¹⁰⁷Ag pairs in the dinuclear Ag₂(µ-dppm) or Ag₂(µ-dppe) structures. Very similar spectra have been reported and analyzed in detail for several dinuclear silver compounds with bridging dppm ligands.³⁷ The separation of the major lines of the spectra allows to estimate coupling constants ¹*J*(P,Ag) ≈ 670 Hz for **17** and ¹*J*(P,Ag) ≈ 660 Hz for **19**, which are comparable to those found in the spectra of **13** and other complexes containing silver centers bonded to only one phosphorus atom.³⁰

Compound 18 crystallizes with two dichloromethane solvent molecules per ionic compound. The structure of the cationic fragment shows two cube-type cores [CuTi₃N₄]

with a dppe ligand linking the two copper atoms (Figure 5). Selected distances and angles of the cation are given in Table 6. The complex has an inversion center located between the two methylene carbon atoms of the dppe ligand. The coordination geometry about each of the two copper atoms could be described as distorted tetrahedral, comprising three nitrogen atoms of the metalloligand and one phosphorous atom of the dppe, with angles N-Cu(1)-N of average $89.8(3)^{\circ}$ and angles P(1)-Cu(1)-N in the range of $114.1(1)-134.2(1)^{\circ}$. The copper-nitrogen bond lengths (2.132(3)-2.166(3) Å) are similar to those found in complexes **4**, **10**, and **14**, and the Cu(1)-P(1) distance (2.219(1) Å) is slightly longer than that observed in **14**. The bond distances and angles around the copper center in **18** compare well with those found in the crystal structures of dinuclear copper(I) complexes containing one bridging dppe ligand.³⁸

Conclusion

We have presented the systematic syntheses of a series of cationic copper(I) and silver(I) complexes incorporating the neutral tridentate imido-nitrido titanium metalloligand 1. These derivatives $[(L)M{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)}][O_3SCF_3]$ were prepared by displacement of the labile trifluoromethanesulfonate ligand in complexes $[(CF_3SO_2O)M\{(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)\}]$ (M = Cu (2), Ag (3)) with more nucleophilic ammine, pyridine, isocyanide or phosphane ligands. Whereas the reaction of 2 or **3** with one equivalent of dppm led to single-cube complexes $[(dppm)M{(\mu_3-NH)_3Ti_3(\eta^5 C_5Me_5_3(\mu_3-N)$ [O₃SCF₃] containing monodentate bisphosphane ligands, the analogous treatment with a half equivalent of dppm or dppe afforded double-cube systems where a bidentate bisphosphane ligand bridge two [{ $M(\mu_3-NH)_3Ti_3(\eta^5-C_5Me_5)_3(\mu_3-N)$] cations.

Acknowledgments. We thank the Spanish MEC (CTQ2008-00061/BQU) and Factoría de Cristalización (CONSOLIDER-INGENIO 2010) for financial support of this research. N.M.-E. thanks the MEC for a doctoral fellowship.

Supporting Information Available: X-ray crystallographic files in CIF format for complexes **4**, **5**, **10**, **14**, **15**, and **18**. This material is available free of charge via the Internet at <u>http://pubs.acs.org</u>.
