#### Abstract

Alkyl-chloro ligand exchange by the reaction of $\left[\mathrm{TaCp}{ }^{*} \mathrm{R}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}\right.$, Me) with $\mathrm{Ph}_{3} \mathrm{CCl}$ gave the monoalkyl compounds $\left[\mathrm{TaCp}{ }^{*} \mathrm{RCl}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right] \quad(\mathrm{R}=$ $\mathrm{CH}_{2} \mathrm{Ph}, \mathrm{Me}$ ). Insertion of CNAr ( $\mathrm{Ar}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}$ ) and CO into a Ta-C bond of the mono- and dialkyl complexes gave the iminoacyl compounds $\left[\mathrm{TaCp} *\left\{\eta^{2}-\mathrm{C}(\mathrm{R})=\mathrm{NAr}\right\}\{\mathrm{O} \cdot \mathrm{B}-\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{X}=\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}, \mathrm{Me} ; \mathrm{X}=\mathrm{Cl}, \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}\right)$ and the acyl compounds $\left[\mathrm{TaCp}^{*} \mathrm{X}\left\{\eta^{2}-\mathrm{C}(\mathrm{R})=\mathrm{O}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right](\mathrm{X}=\mathrm{R}=$ $\left.\mathrm{CH}_{2} \mathrm{Ph}, \mathrm{Me} ; \mathrm{X}=\mathrm{Cl}, \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}\right)$, respectively. The related chloro compound $\left[\mathrm{TaCp}{ }^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ was isolated from the reaction of the oxo derivative

#### Abstract

$\left[\mathrm{TaCp}{ }^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]$ with the Lewis acid $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$. Addition of CNAr or pyridine to $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)\left\{\eta^{2}\right.\right.$ $\left.\left.\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Ph}\right)=\mathrm{NAr}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ afforded the borane-free complex $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Ph}\right)=\mathrm{NAr}\right\}(\mathrm{O})\right]$ and the acidbase adduct $\mathrm{L} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}(\mathrm{~L}=\mathrm{py}, \mathrm{CNAr})$. The molecular structures of $\left[\mathrm{TaCp}^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right] \quad$ and $\left[\mathrm{TaCp}^{*}\left(\mathrm{CH}_{2} \mathrm{Ph}\right)\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Ph}\right)=\mathrm{O}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ were obtained from X-ray diffraction studies.

## Introduction

The formation of $\mathrm{C}-\mathrm{C}$ bonds through insertion of isocyanides (CNR) and carbon monoxide (CO) into $\mathrm{M}-\mathrm{C}$ bonds is well-documented, and this reaction initially affords iminoacyl and acyl complexes, respectively. ${ }^{[1]}$ For a given metal atom, the stability and further evolution of these compounds are determined by the nature of the ancillary ligands. Many reaction pathways may follow to give a broad variety of products: ${ }^{[1]}$ (a) migratory insertion of a second alkyl or aryl group to give $\eta^{2}$-imine or $\eta^{2}$-ketene complexes; ${ }^{[2-5]}$ (b) intra- or intermolecular coupling of iminoacyl or acyl units affording diaza- or dioxobutene complexes; ${ }^{[6,7]}$ (c) transfer of the NR or O moieties to the metal centre; ${ }^{[8-11]}(\mathrm{d})$ insertion of a second $\mathrm{CNR}^{[12-16]}$ or $\mathrm{CO}^{[17]}$ molecule into the new $\mathrm{M}-\mathrm{C}$ bond formed after the first insertion process and (e) hydrogen migration. ${ }^{[18,19]}$

We reported the results of our studies on the insertion reactions of CNR into the Ta-C(methyl) bond of monocyclopentadienyl complexes of the type $\left[\mathrm{TaCp} * \mathrm{Cl}_{x} \mathrm{Me}_{4-x}\right]^{[8-10]}$ for which processes (a) and (c) were observed. Similar reactions with imido compounds of the type $[\mathrm{TaCp} * \mathrm{MeX}(\mathrm{N} t \mathrm{Bu})](\mathrm{X}=\mathrm{Cl}, \mathrm{Me}, \mathrm{OR}, \mathrm{NH} t \mathrm{Bu})$ gave

[^0]the imine- $\eta^{2}$-iminoacyl derivatives $\left[\mathrm{TaCp} *(\mathrm{~N} t \mathrm{Bu}) \mathrm{X}\left\{\eta^{2}{ }^{2}\right.\right.$ $\mathrm{C}[\mathrm{C}(\mathrm{Me})=\mathrm{NR}]=\mathrm{NR}\}] \cdot{ }^{[20]}$ With regard to the CO insertion reactions, double migration of the alkyl group [process (a)] was observed for $\left[\mathrm{TaCp} * \mathrm{Cl}_{2} \mathrm{Me}_{2}\right],{ }^{[10]}$ whereas the coupling of the acyl groups [process (b)] occurred for $\left[\mathrm{TaCp} * \mathrm{Me}_{2}(\mathrm{NR})\right]\left(\mathrm{R}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)$ to give the dinuclear compound $\left[\mathrm{TaCp} *(\mathrm{NR}) \mathrm{Me}_{2}\left\{\mu-\eta^{2}-\mathrm{OC}(\mathrm{Me})=\mathrm{C}(\mathrm{Me}) \mathrm{O}\right\},{ }^{[10]}\right.$ and ligand exchange [process (c)] for complexes $[\mathrm{TaCp} * \mathrm{ClMe}(\mathrm{NR})]\left(\mathrm{R}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3},{ }^{[10]} t \mathrm{Bu}\right)^{[11]}$ led to the oxo compounds $\left[\mathrm{TaCp} * \mathrm{Cl}(\mathrm{O})\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NR}\right\}\right]$. Furthermore, the $\eta^{2}$-(methyl)acyl complexes remained elusive and were only detected as intermediates by NMR spectroscopy, whereas the related $\eta^{2}$-iminoacyl complexes are stable.

It was observed that for monocyclopentadienyl imido tantalum derivatives addition of a second CNR molecule into the iminoacyl compounds $\left[\mathrm{TaCp} *(N R) X\left\{\eta^{2}\right.\right.$ -$\mathrm{C}(\mathrm{Me})=\mathrm{NR}\}]\left(\mathrm{R}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}, t \mathrm{Bu} ; \mathrm{X}=\mathrm{Cl}, \mathrm{Me}\right)$ resulted in differing behaviours depending on the R group of the imido ligand. No reaction was found for $\mathrm{R}=2,6$ $\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3},{ }^{[10]}$ whereas a second insertion occurred for $\mathrm{R}=$ $t$ Bu. ${ }^{[20]}$ Conversely, the imido complexes [TaCp*MeX(NR)] ( $\mathrm{R}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}, t \mathrm{Bu} ; \mathrm{X}=\mathrm{Cl}, \mathrm{Me}$ ) reacted with CO to give the dinuclear compound $[\mathrm{TaCp} *(N R) M e]_{2}\left\{\mu-\eta^{2}-\mathrm{OC}-\right.$ $(\mathrm{Me})=\mathrm{C}(\mathrm{Me}) \mathrm{O}\}$ for $\mathrm{X}=\mathrm{Me}^{[10]}$ and one of the few mononuclear derivatives $\left[\mathrm{TaCp} * \mathrm{Cl}(\mathrm{O})\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NR}\right\}\right]$ containing a terminal tantalum-oxo double bond for $\mathrm{X}=\mathrm{Cl} .^{[10,11]}$

The versatility and potential applications of all these results determined by the R and X substituents of the imido
complexes $[\mathrm{TaCp} * \mathrm{MeX}(\mathrm{NR})]$ led us to extend our studies to similar insertion reactions of CNR and CO into the Taalkyl bonds of the related oxo-borane compounds $\left[\mathrm{TaCp} * \mathrm{X}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ that have recently been isolated. ${ }^{[21]}$

## Results and Discussion

The monoalkyl oxo-borane compounds $\left[\mathrm{TaCp} * \mathrm{RCl}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph} 1 \mathrm{c}, \mathrm{Me} 1 \mathrm{~d}\right)$ were synthesised by an alkyl-chloro metathesis reaction of $\left[\mathrm{TaCp} * \mathrm{R}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph} 1 \mathbf{1 a}, \mathrm{Me} 1 \mathrm{~b}\right)$ with one equiv. of $\mathrm{Ph}_{3} \mathrm{CCl}$ as chlorinating agent (Scheme 1). The reaction for $\mathbf{1 c}$ proceeded smoothly at room temperature to give a pale yellow solid in good yield, whereas complex 1d could not be isolated in the solid state. The formation of 1d was demonstrated on a small scale by ${ }^{1} \mathrm{H}$ NMR spectroscopy with a $\mathrm{C}_{6} \mathrm{D}_{6}$ solution of $\mathbf{1 b}$ that was treated with $\mathrm{Ph}_{3} \mathrm{CCl}$ and heated to $40^{\circ} \mathrm{C}$. All attempts made to obtain the monomethyl complex through alkylation of $\left[\mathrm{TaCp} * \mathrm{Cl}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ and redistribution reactions between $\left[\mathrm{TaCp}^{*} \mathrm{Cl}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ and $\left[\mathrm{TaCp} * \mathrm{Me}_{2}\{\mathrm{O} \cdot \mathrm{B}\right.$ $\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}$ ] failed. The ${ }^{11} \mathrm{~B}$ and ${ }^{19} \mathrm{~F}$ NMR spectra of complexes $\mathbf{1 c}$ and $\mathbf{1 d}$ are consistent with the presence of a tetracoordinate boron atom, ${ }^{[21-31]}$ and the ${ }^{1} \mathrm{H}$ NMR spectra with the monosubstitution of only one of the alkyl ligands.

Scheme 1.
The alkyl complexes $\left[\mathrm{TaCp}^{*} \mathrm{R}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ ( $\mathrm{R}=$ $\mathrm{CH}_{2} \mathrm{Ph} 1 \mathrm{1a}, \mathrm{Me}$ 1b) and $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right) \mathrm{Cl}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ (1c) immediately reacted at room temperature with one equiv. of the isocyanide $\mathrm{CNAr}\left(\mathrm{Ar}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)$ to give the corresponding $\eta^{2}$-iminoacyl compounds $\left[\mathrm{TaCp} * \mathrm{X}\left\{\eta^{2}-\mathrm{C}(\mathrm{R})=\mathrm{NAr}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right] \quad \mathrm{X}=\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}$ $\mathbf{2 a}$, $\mathrm{Me} \mathbf{2 b}$; $\mathrm{X}=\mathrm{Cl}, \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph} \mathbf{2 c}$ ) in high yields by insertion of the isocyanide ligand into a $\mathrm{Ta}-\mathrm{C}$ bond (Scheme 1).

These pale yellow complexes are air and thermally stable in solution. The ${ }^{13} \mathrm{C}$ NMR resonance at ca. $\delta=240 \mathrm{ppm}$ is the most apparent spectroscopic feature and confirms the presence of the $\eta^{2}$-iminoacyl ligand in complexes $\mathbf{2}$.

We previously reported ${ }^{[10]}$ on the isolation of the related oxo complex $\left[\mathrm{TaCp}^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]$ from the reaction of the monomethyl compound [ $\mathrm{TaCp} * \mathrm{ClMe}(\mathrm{NAr})]$ with CO through a process that involved insertion of CO into the $\mathrm{Ta}-\mathrm{Me}$ bond and further rearrangement of the $\eta^{2}$ acyl intermediate with intramolecular oxo-imido exchange. Since the starting oxo-borane chloro-methyl complex could not be isolated, thus preventing access to the oxo-borane compound $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ (2d) by insertion of CNAr into the $\mathrm{Ta}-\mathrm{C}$ bond of the corresponding alkyl-chloro compound, we tried to obtain this compound by an alternative route. With this aim, we investigated the reaction of the oxo iminoacyl compound $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]$ with $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$, which afforded $\mathbf{2 d}$ in high yield. The formation of $\mathbf{2 d}$ was confirmed by ${ }^{13} \mathrm{C}$ and ${ }^{19} \mathrm{~F}$ NMR spectroscopy. The ${ }^{13} \mathrm{C}$ NMR spectrum shows the resonance corresponding to the $\mathrm{C}_{\mathrm{sp}^{2}}$ atom of the $\eta^{2}$-iminoacyl ligand ( $\delta=240.1 \mathrm{ppm}$ ) to be slightly low-field shifted with respect to that of the starting compound $\left[\mathrm{TaCp}{ }^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right](\delta=236.8 \mathrm{ppm})$. An analogous behaviour was observed in the ${ }^{1} \mathrm{H}$ NMR spectrum for the methyl-iminoacyl group, which was shifted from $\delta=2.65 \mathrm{ppm}$ in $\left[\mathrm{TaCp}^{*} \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]$ to $\delta$ $=2.94 \mathrm{ppm}$ in $\mathbf{2 d}$.

The molecular structure of compound $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}\right.\right.$ $\left.\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{Ar}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)(\mathbf{2 d})$ was obtained by X-ray diffraction studies. Figure 1 depicts an ORTEP drawing of $\mathbf{2 d}$ with selected bond lengths and angles. Compound 2d exhibits the typical geometry known for group 5 half-sandwich iminoacyl compounds with a tetrahedral coordination environment around the tantalum atom. Considering the centroid of the $\mathrm{Cp}^{*}$ ring and the midpoint of the $\mathrm{C}(10)-\mathrm{N}$ bond as coordination sites, the other two positions are occupied by the chloro and oxo ligands. The N atom of the $\eta^{2}$-iminoacyl group is located in a trans position with respect to the oxo ligand, as in analogous half-sandwich imido complexes and in $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}\right.\right.$ $\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\}(\mathrm{O})]$. Furthermore, the oxygen atom is attached to the boron atom of the $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ group.

All the values of the bond lengths and angles of compound $\mathbf{2 d}$ are very close to the corresponding bond lengths and angles found for the parent compound $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}-\right.\right.$ $\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\}(\mathrm{O})]^{[10]}$ except for the $\mathrm{Ta}-\mathrm{O}$ bond, which is longer in $\left.\left[\mathrm{TaCp} * \mathrm{Cl}^{2} \eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right][1.731(7) \AA]$ than in $\mathbf{2 d}[1.809(5) \AA$ ] as a consequence of the coordination of the oxygen atom to the $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ ligand. ${ }^{[21,23-28,30,31]}$ The linear $\mathrm{Ta}-\mathrm{O}-\mathrm{B}$ angle $\left[174.4(6)^{\circ}\right]$ and the $\mathrm{B}-\mathrm{O}$ bond length $\left[1.52(1) \AA\right.$ ] are typical of oxo-borane compounds. ${ }^{[21-31]}$ The $\mathrm{Ta}-\mathrm{O}$ bond in $\mathbf{2 d}$ is longer than that in the oxo-borane compound $\left[\mathrm{TaCp} * \mathrm{Cl}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]^{[21]}[1.784(2) \AA$. A . This bond length is similar to the lower end of the range of $\mathrm{Ta}-\mathrm{O}$ bond lengths for compounds with $\mathrm{Ta}-\mathrm{O}-\mathrm{Ta}$ bridges $(1.82-2.10 \AA)$ ${ }^{[32-35]}$ and with terminal $\mathrm{Ta}-\mathrm{OH}$ bonds $(1.85-1.97 \AA) .{ }^{[36-38]}$ However, the single bond $\mathrm{Ta}-\mathrm{O}$ distances are ca. $2.18 \AA$,

Figure 1. ORTEP diagram of the X-ray structure of compound 2d. Thermal ellipsoids are drawn at the $50 \%$ level, and hydrogen atoms and $\mathrm{C}_{6} \mathrm{~F}_{5}$ groups have been omitted for clarity. Selected bond lengths [A] and angles [ ${ }^{\circ}$ ]: Ta-O 1.809(5), Ta-N 2.127(7), Ta-C(10) $2.120(9), \mathrm{Ta}-\mathrm{Cl} 2.392(2), \mathrm{B}-\mathrm{O} 1.525(11), \mathrm{N}-\mathrm{C}(10) 1.26(1), \mathrm{N}-\mathrm{Ta}-$ $\mathrm{C}(10) 34.5(3), \mathrm{C}(10)-\mathrm{N}-\mathrm{Ta} 72.4(5), \mathrm{N}-\mathrm{C}(10)-\mathrm{Ta} 73.1(5), \mathrm{B}-\mathrm{O}-\mathrm{Ta}$ 174.4(6).
and thus a bond order of two should be considered for the $\mathrm{Ta}-\mathrm{O}$ bond in $\mathbf{2 d}$.

The reaction of the dialkyl $\left[\mathrm{TaCp}^{*} \mathrm{R}_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right](\mathrm{R}$ $\left.=\mathrm{CH}_{2} \mathrm{Ph} 1 \mathrm{a}, \mathrm{Me} \mathbf{1 b}\right)$ and the monobenzyl $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)-\right.$ $\left.\mathrm{Cl}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ (1c) complexes with CO in toluene gave the $\quad \eta^{2}$-acyl compounds $\left[T a C p^{*} X\left\{\eta^{2}-C(R)=O\right\}\{O \cdot B-\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]\left(\mathrm{X}=\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph} 3 \mathrm{a}, \mathrm{Me} 3 \mathrm{~b} ; \mathrm{X}=\mathrm{Cl}, \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}\right.$ 3c) after ca. 24 h at room temperature in moderate yields (Scheme 1). These pale yellow compounds were air and thermally stable below $120{ }^{\circ} \mathrm{C}$ for several hours. The ${ }^{13} \mathrm{C}$ NMR spectra showed a resonance at ca. $\delta=305 \mathrm{ppm}$ corresponding to the $\mathrm{C}_{\mathrm{sp}^{2}}$ atom of the $\eta^{2}$-acyl fragment. The slowness of the insertion reactions of CO is in contrast with the rapid transformations observed for complexes $\mathbf{1}$ with isocyanide and the behaviour observed ${ }^{[10,11]}$ for the reactions of the imido compounds $[\mathrm{TaCp} * \mathrm{MeX}(\mathrm{NR})](\mathrm{R}=2,6-$ $\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}, t \mathrm{Bu} ; \mathrm{X}=\mathrm{Cl}, \mathrm{Me}$ ) with CO . This difference may be attributed to the lower oxophilicity of the tantalum atom in compounds 1 that is caused by the presence of the oxo ligand.

The X-ray structure of compound 3a is shown in Figure 2. The environment around the Ta atom is analogous to that described for compound $\mathbf{2 d}$ (see above) with the oxygen atom of the acyl group located trans to the oxo-borane ligand, as expected. The Ta-O(1) bond length of $1.816(2) \AA$ is similar to that observed for compound 2d, and the $\mathrm{O}(1)-$ B bond length $[1.512(4) \AA]$ and $\mathrm{Ta}-\mathrm{O}(1)-\mathrm{B}$ angle $\left[173.0(2)^{\circ}\right]$ have values that are normally seen for these types of compounds. ${ }^{[21-31]}$

The whole set of angles and bond lengths of the [Ta- $\left(\eta^{2}-\right.$ acyl)] group is in line with compounds of this type ${ }^{[1]}$ and is similar to those found in the other two tantalum-acyl complexes for which X-ray structures are known, $\left[\mathrm{TaCp} * \mathrm{Me}\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{CMe}_{2} \mathrm{Ph}\right)=\mathrm{O}\right\}\left\{\mathrm{N}\left(2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)\right\}\right]^{[39]}$ and $\left[\mathrm{TaCp} * \mathrm{Cl}_{3}\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{CMe}_{3}\right)=\mathrm{O}\right\}\right]{ }^{[40]}$ However, in the particular case of the isostructural imido derivative $\left[\mathrm{TaCp} * \mathrm{Me}\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{CMe}_{2} \mathrm{Ph}\right)=\mathrm{O}\right\}\left\{\mathrm{N}\left(2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)\right\}\right]$, the $\mathrm{Ta}-\mathrm{O}$ bond $[2.21(1) \AA$ ] is slightly longer than the corre-

Figure 2. ORTEP diagram of the X-ray structure of compound 3a. Thermal ellipsoids are drawn at the $50 \%$ level, and hydrogen atoms and $\mathrm{C}_{6} \mathrm{~F}_{5}$ groups have been omitted for clarity. Selected bond lengths $[\AA]$ and angles [ ${ }^{\circ}$ ]: $\mathrm{Ta}-\mathrm{O}(1) 1.816(2), \mathrm{Ta}-\mathrm{O}(2) 2.110(3), \mathrm{Ta}-$ $\mathrm{C}(1)$ 2.229(4), $\mathrm{Ta}-\mathrm{C}(2)$ 2.011(3), $\mathrm{B}-\mathrm{O}(1)$ 1.512(4), $\mathrm{O}(2)-\mathrm{C}(2)$ $1.209(4), \mathrm{O}(2)-\mathrm{Ta}-\mathrm{C}(2) 34.02(12), \mathrm{C}(2)-\mathrm{O}(2)-\mathrm{Ta} 68.5(2), \mathrm{O}(2)-$ $\mathrm{C}(2)-\mathrm{Ta} 77.5(2), \mathrm{B}-\mathrm{O}(1)-\mathrm{Ta} 173.02(19)$.
sponding bond in compound $\mathbf{3 a}$ [2.110(3) $\AA$ ], because of the different trans effect and higher donor capacity of the imido ligand.
The insertion of a second CNAr or CO molecule into these new acyl and iminoacyl oxo-borane complexes was not observed, in contrast with the behaviour observed for the analogous tert-butyl imido complexes. ${ }^{[20]}$ Rather, all complexes 2-3 released the acid-base adduct $\mathrm{L} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}(\mathrm{~L}$ $=$ py, CNAr) in the presence of donor ligands such as isocyanide or pyridine. ${ }^{[4]]}$ Only in the case of compound 2a were we able to isolate the borane-free 18 -electron compound $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)\left\{\eta^{2}-\mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Ph}\right)=\mathrm{NAr}\right\}(\mathrm{O})\right](4 \mathrm{a})$, with a terminal oxo-tantalum bond. The remaining oxo-borane complexes decomposed under similar conditions. The ${ }^{13} \mathrm{C}$ NMR spectrum of the new oxo iminoacyl compound $\mathbf{4 a}$ showed the $\eta^{2}$-iminoacyl $\mathrm{C}_{\mathrm{sp}^{2}}$ resonance at $\delta=240.3 \mathrm{ppm}$. A comparison of this ${ }^{13} \mathrm{C}$ resonance and that assigned to the $\mathrm{CH}_{2}-$ iminoacyl group in the ${ }^{1} \mathrm{H}$ NMR spectrum with the corresponding resonances in the parent compound $\mathbf{2 a}$, showed a behaviour that is opposite to that observed for 2d and $\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]$.

## Conclusions

The dialkyl oxo-borane compounds $\left[\mathrm{TaCp} * \mathrm{R}_{2}\{\mathrm{O} \cdot \mathrm{B}-\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ can be transformed into the monoalkyl derivatives $\left[\mathrm{TaCp} * \mathrm{RX}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ by alkyl-chloro exchange with $\mathrm{Ph}_{3} \mathrm{CCl}$. All of these complexes reacted with one molecule of isocyanide or carbon monoxide to give the $\eta^{2}$-iminoacyl or $\eta^{2}$-acyl compounds, respectively. No further insertion processes have been observed. This behaviour is analogous to that observed for the imido compounds $[\mathrm{TaCp} * \operatorname{MeX}(\mathrm{NR})]\left(\mathrm{R}=2,6-\mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3} ; \mathrm{X}=\mathrm{Cl}, \mathrm{Me}\right)$, although in the oxo-borane compounds the insertion of CO gave stable $\eta^{2}$-acyl derivatives because of the presence of a Ta-O multiple bond, which prevents further rearrangement.

## Experimental Section

All manipulations were carried out under argon, and solvents were distilled from appropriate drying agents. NMR spectra were recorded at 300.13 ( ${ }^{1} \mathrm{H}$ NMR), 188.31 ( ${ }^{19} \mathrm{~F}$ NMR), 75.47 ( ${ }^{13} \mathrm{C}$ NMR) and $128.38 \mathrm{~Hz}\left({ }^{11} \mathrm{~B} \mathrm{NMR}\right)$ at room temperature with a Varian Unity $300\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{19} \mathrm{~F}\right)$ or Bruker Advance $400\left({ }^{11} \mathrm{~B}\right.$ NMR) instrument. Chemical shifts $\left(\delta, \mathrm{CDCl}_{3}\right)$ are given in ppm, relative to internal TMS ( ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR), and external $\mathrm{CFCl}_{3}\left({ }^{19} \mathrm{~F}\right.$ NMR) and $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}\left({ }^{11} \mathrm{~B} \mathrm{NMR}\right)$. Elemental analyses were performed with a Perkin-Elmer 240C instrument. Compounds $\left[\mathrm{TaCp}^{*} \mathrm{Me}_{4}\right],{ }^{[42]} \quad\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right],{ }^{[21]} \quad\left[\mathrm{TaCp} * \mathrm{Me}_{2^{-}}\right.$ $\left.\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right],{ }^{[21]} \quad\left[\mathrm{TaCp} * \mathrm{Cl}\left\{\eta^{2}-\mathrm{C}(\mathrm{Me})=\mathrm{NAr}\right\}(\mathrm{O})\right]^{[10]} \quad$ and $\quad \mathrm{B}-$ $\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}{ }^{[43]}$ were prepared by literature methods, and $\mathrm{H}_{2} \mathrm{O} \cdot \mathrm{B}$ $\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}{ }^{[44]}$ was prepared from $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ in toluene at room temperature and used in situ without further purification.
$\left[\mathrm{TaCp} * \mathrm{Cl}\left(\mathbf{C H}_{\mathbf{2}} \mathbf{P h}\right)\left\{\mathbf{O} \cdot \mathbf{B}\left(\mathrm{C}_{6} \mathbf{F}_{5}\right)_{3}\right\}\right]$ (1c): A suspension of $\mathrm{Ph}_{3} \mathrm{CCl}$ $(0.14 \mathrm{~g}, \quad 0.50 \mathrm{mmol})$ and $\left[\mathrm{TaCp} *\left(\mathrm{CH}_{2} \mathrm{Ph}\right)_{2}\left\{\mathrm{O} \cdot \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right\}\right]$ (1a) $(0.50 \mathrm{~g}, 0.49 \mathrm{mmol})$ in toluene $(5 \mathrm{~mL})$ was stirred overnight at room temperature, with a colour change from yellow to brown. Later, all volatile components were removed under vacuum until the volume was ca. 1 mL , leaving a dark oil that was washed with hexane $(2 \times 10 \mathrm{~mL})$ to yield $\mathbf{1 c}$ as a brownish solid $(0.36 \mathrm{~g}, 76 \%)$. $\mathrm{C}_{35} \mathrm{H}_{22} \mathrm{BClF}_{15} \mathrm{OTa}$ (970.75): calcd. Crystal Structure Determination for 2d and 3a: Selected crystals were covered with perfluoropolyether oil and mounted on a Nonius KAPPA-CCD single crystal diffractometer. The crystal structure was solved by direct methods and refined using full-matrix leastsquares on $F^{2}$ (SHELXL-97). All non-hydrogen atoms were anisotropically refined. Hydrogen atoms were geometrically placed and left riding on their parent atoms. Two molecules of toluene crystal-

Table 1. Crystallographic data for compounds 2d and 3a.

| Compound | 2d | 3a |
| :--- | :--- | :--- |
| Empirical formula | $\mathrm{C}_{52} \mathrm{H}_{43} \mathrm{BClF}_{15} \mathrm{NOTa}^{2}$ | $\mathrm{C}_{50} \mathrm{H}_{37} \mathrm{BF}_{15} \mathrm{O}_{2} \mathrm{Ta}$ |
| Formula mass | 1210.08 | 1146.56 |
| $\lambda[\AA]$ | 0.71069 | 0.71069 |
| Crystal system | triclinic | triclinic |
| Space group | $P \overline{1}$ | $P \overline{1}$ |
| $T[\mathrm{~K}]$ | $200(2)$ | $150(2)$ |
| $a[\AA]$ | $9.565(1)$ | $12.739(2)$ |
| $b[\AA]$ | $13.7547(3)$ | $13.171(2)$ |
| $c[\AA]$ | $19.545(3)$ | $15.104(2)$ |
| $a\left[{ }^{\circ}\right]$ | $77.483(7)$ | $88.20(1)$ |
| $\beta\left[{ }^{\circ}\right]$ | $79.50(1)$ | $82.58(2)$ |
| $\gamma\left[{ }^{\circ}\right]$ | $71.389(4)$ | $63.20(1)$ |
| $V\left[\AA^{3}\right]$ | $2361.1(5)$ | $2242.1(6)$ |
| $Z$ | 2 | 2 |
| Calcd. density [mg m $\left.{ }^{-3}\right]$ | 1.572 | 1.698 |
| Absorption coefficient $\left[\mathrm{mm}^{-1}\right]$ | 2.478 | 2.555 |
| $\theta$ range [ $\left.{ }^{\circ}\right]$ | $3.52-27.50$ | $3.61-27.50$ |
| Reflections collected/unique reflections | $13375 / 8067$ | $19150 / 10201$ |
| $R($ int. $)$ | 0.0863 | 0.0228 |
| Data/restraints/parameters | $8067 / 3 / 586$ | $10201 / 239 / 622$ |
| GOF | 1.101 | 1.042 |
| Final $R$ indices | $R_{1}=0.0575$ | $R_{1}=0.0292$ |
| $[I>2 \sigma(I)]$ | $w R_{2}=0.1211$ | $w R_{2}=0.0678$ |
| Largest diff. peak/hole $\left[\mathrm{e} \AA^{-3}\right]$ | $1.596 /-1.899$ | $1.303 /-1.364$ |

lised with every molecule of $\mathbf{2 d}$; both solvent molecules were found in the difference Fourier map but one of them was very disordered and it was not possible to get a chemically sensible model for it, so the Squeeze procedure ${ }^{[45]}$ was used to remove its contribution to the structural factors. In 3a some restraints on the solvent molecule were applied. Crystal data for both compounds are given in Table 1. CCDC-272817 (for 2d) and CCDC-272818 (for 3a) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
