CASSOFI

SKYLAB CRYSTAL -- A space-grown crystal that may allow computers to be reduced to a tenth their present size is presented to President Gerald Ford. The crystal, called immeasurably the most pure and of the longest life yet produced by man, was the result of a Massachusetts Institute of Technology (MIT) experiment aboard the Skylab station in Earth orbit. NASA administrator James Fletcher (left) said it could lead to a new billion-dollar industry. At right is Howard Johnson, MIT board chairman. (74-2523)
